

Covid Shots Are SOLE Cause of Soaring Child Heart Failure, Harvard Study Confirms

A major new study has just confirmed that Covid mRNA shots are the sole cause of the soaring cases of heart failure among children.

As Slay News has been reporting, cases of cardiac-related deaths and heart failure such as myocarditis and pericarditis have been soaring around the world since Covid injections were rolled out to the public in early 2021.

Subscribe

Myocarditis and pericarditis are inflammatory conditions of the heart and are generally considered to be rare, especially among children.

Severe cases can lead to serious complications and even death.

Both conditions are known side effects of the Covid mRNA shots.

In response, health officials and the corporate media have been pushing the claim that the [non existent] COVID-19 virus, and not the shots, is behind the phenomenon.

However, a new large-scale study from renowned scientists at the prestigious University of Oxford has just confirmed that **myocarditis and pericarditis only appear in children and adolescents after Covid vaccination** and not after infection from the virus [flu renamed].

The new study looked at the official government data of more than 1 million English children and adolescents aged between five and 11 and 12 and 15.

The study compared vaccinated and unvaccinated subjects.

The researchers also took into account the number of doses of vaccine received.

In detailing their findings, the researchers wrote:

“All myocarditis and pericarditis events during the study period occurred in vaccinated individuals.”

The study also noted that hospitalization related to COVID-19 [flu] was extremely rare among children and adolescents.

Additionally, there were no deaths from the [alleged] virus [aka the flu] recorded among the entire subject population.

The English data show that myocarditis and pericarditis were only recorded in vaccinated children and adolescents.

Other studies have claimed that myocarditis risk is higher after infection with the [alleged] virus.

Adolescents had a significantly higher risk of contracting the conditions than children. The vast majority of myocarditis and pericarditis cases occurred after the first dose of the vaccine, the study found.

Over half of the adolescents who suffered from the conditions visited the hospital as a result.

This news follows another recent study, from some of America's most well-respected researchers, that found that Covid shots were responsible for for soaring sudden deaths around the world.

As Slay News reported, the case study was conducted by Harvard Medical School and chronicled soaring cases of fatal cerebral ischemia over the past three years.

Cerebral ischemia is a form of deadly brain damage triggered by insufficient blood flow to the brain.

The Harvard researchers found that Moderna's Covid mRNA injections specifically caused the recent spike in the fatal disorder.

Leading experts have been responding to the explosive study by raising the alarm about the mRNA vaccines.

The Harvard study is the latest in a long line of studies linking the shots to sudden death and potentially fatal side effects.

In response to the Harvard study, Dr. John Campbell – a top British oncologist, immunologist, and immunotherapy expert, published a video breaking down the results.

"This could not be a more serious report," Campbell warns.

Dr. Peter McCullough also discussed this case study on his Substack.

“We are becoming accustomed to unexpected death after COVID-19 among young persons who have taken one or more injections of the COVID-19 vaccine,” McCullough said.

“It is important to realize that not all deaths after vaccination are cardiac.”

Slay News recently reported on the bombshell admission from the U.S. Centers for Disease Control and Prevention (CDC) that the **Covid mRNA shots have killed hundreds of thousands of American children and young people.**

The explosive admission was uncovered in a secret **CDC report showing that a staggering half a million American children and young adults have been killed by Covid shots.**

The CDC report has revealed that almost 500,000 Americans aged between 0 and 44 years old died from the dangerous side effects of the Covid mRNA injections.

The recorded deaths occurred between the start of the public rollout of the shots in early 2021 and October 9, 2022.

However, due to the timeline of the data, the already shocking figures do not include deaths recorded over the past year and a half.
